

Installing SkyWater PDK Toolchain by OSIC on WSL

INSTALLATION MANUAL FOR WINDOWS 11

1. In order to install the toolchain, start by installing [WSL](#) on your window by turning it ON. For this, open the control panel and look for “turn window features on or off”. Check mark the options shown in fig. via red check mark.

This will prompt you to restart your computer.

2. Next download the [Linux Kernal package](#). For this, consider following this link.

<https://learn.microsoft.com/en-us/windows/wsl/install-manual>

After following the instructions shown in this link, you’ll be all done with launching the Linux distribution as well (as ubuntu in our case, Ubuntu vers. 22.04).

3. Now open the terminal on your computer as we are about to [update WSL](#). For this consider entering this command on terminal.
 - `wsl --update`

You **should** be able to get this result.

```
PS C:\Users\Namra Mazhar> wsl --update
Checking for updates.
The most recent version of Windows Subsystem for Linux is already installed.
PS C:\Users\Namra Mazhar>
```

4. In order to check what’s been installed in your WSL. Enter this command
 - `wsl -l`

```
PS C:\Users\Namra Mazhar> wsl -l
```

You should get this output:

Windows Subsystem for Linux has no distributions installed.

5. We will now **install Ubuntu**. For this enter this command

- `wsl --install -d Ubuntu-22.04`

```
PS C:\Users\Namra Mazhar> wsl --install -d Ubuntu-22.04
```

It will ask you to enter your “username” and “password” and within a few seconds you’ll have Ubuntu installed.

6. Now, we will;

Add a new repository containing the apt-fast package.

Update the package lists to include packages from the newly added repository.

Install the apt-fast package.

For this, consider following this link

<https://github.com/ilikenwf/apt-fast>

Scroll down and you’ll able to find the heading **Installation** with 3 commands underneath.

Installation

```
sudo add-apt-repository ppa:apt-fast/stable
sudo apt-get update
sudo apt-get -y install apt-fast
```

Enter the first command and run it.

```

namramazhar@DESKTOP-L77  x  +  v  -  □  x
namramazhar@DESKTOP-L7738L0:~$ sudo add-apt-repository ppa:apt-fast/stable
[sudo] password for namramazhar:

namramazhar@DESKTOP-L7738L0:~$ |

```

Similarly run 2nd and 3rd command. While running the 3rd command, you'll see a pop up regarding apt configuration. Select the following;

1. Apt
2. 5
3. No

7. We'll now install make and gedit. For this, enter the following command

- make

```
namramazhar@DESKTOP-L7738L0:~$ make
```

Then enter,

- `sudo apt-fast install make`

```
namramazhar@DESKTOP-L7738L0:~$ sudo apt-fast install make
```

You'll be able to install "make" with this.

Next comes gedit. To install it, enter

- `sudo apt-fast install gedit`

```
namramazhar@DESKTOP-L7738L0:~$ sudo apt-fast install gedit
```

In order to check whether you have successfully installed it, simply add these cmds.

```
namramazhar@DESKTOP-L7738L0:~$ make
make: *** No targets specified and no makefile found. Stop.
```

```
namramazhar@DESKTOP-L7738L0:~$ gedit
```

You'll see a blank doc opening up for gedit output.

8. We will now [Install the Python dependencies](#) to avoid potential conflicts during the toolchain installation process. For this, enter

- `pip install cffi cryptography pycparser setuptools pip`

```
(base) namramazhar@DESKTOP-L7738L0:~$ pip install cffi cryptography pycparser setuptools pip
```

9. We are now starting software installation, for this start by cloning "OSIC GitHub Repository". For this enter this command

- `git clone https://github.com/iic-jku/osic-multitool.git`

```
namramazhar@DESKTOP-L7738L0:~$ git clone https://github.com/iic-jku/osic-multitool.git
```

Afterwards, we'll navigate through this folder by

- `cd osic-multitool/`

```
namramazhar@DESKTOP-L7738L0:~$ cd osic-multitool/
namramazhar@DESKTOP-L7738L0:~/osic-multitool$
```

To see what's inside this folder, enter

- `ls`

```

namramazhar@DESKTOP-L7738L0:~/osic-multitool$ ls
LICENSE                               iic-dffram-install.sh  iic-pex.sh
README.md                             iic-dffram.sh          iic-spice-model-red.py
caravel_setup                         iic-drc.sh             iic-v2sch.awk
example                              iic-layconv.sh         iic-v2svg.sh
gds3d.sh                             iic-lvs.sh             iic-vlint.sh
iic-chipart-install.sh               iic-magic-bindkeys     magic-cheatsheet
iic-chipart.sh                       iic-osic-setup.sh      openvaf
iic-clean.sh                         iic-pdk-script.sh
namramazhar@DESKTOP-L7738L0:~/osic-multitool$

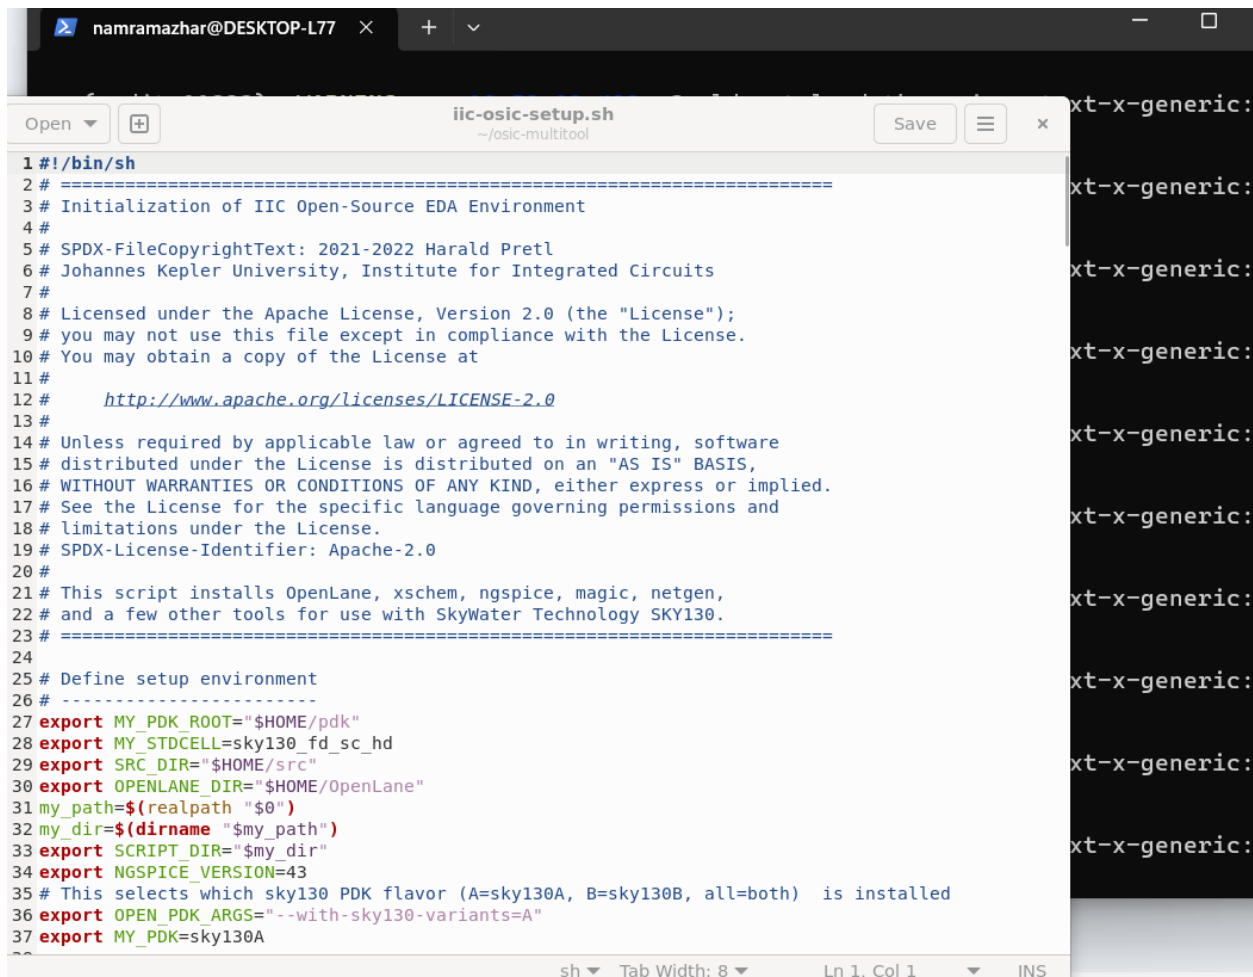

```

10. Now, we'll do some modifications in the script to adjust parameters as per our setup.

For this, execute this cmd

- gedit iic-osic-setup.sh

you'll see this as output

```

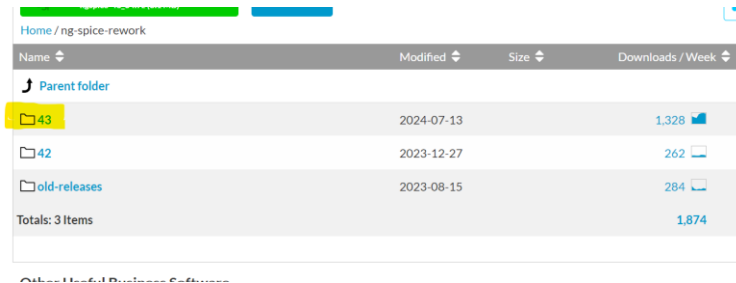

1 #!/bin/sh

21 # This script installs OpenLane, xschem, ngspice, magic, netgen,
22 # and a few other tools for use with SkyWater Technology SKY130.
23 # =====
24
25 # Define setup environment
26 # -----
27 export MY_PDK_ROOT="$HOME/pdk"
28 export MY_STDCELL=sky130_fd_sc_hd
29 export SRC_DIR="$HOME/src"
30 export OPENLANE_DIR="$HOME/OpenLane"
31 my_path=$(realpath "$0")
32 my_dir=$(dirname "$my_path")
33 export SCRIPT_DIR="$my_dir"
34 export NGSPICE_VERSION=43
35 # This selects which sky130 PDK flavor (A=sky130A, B=sky130B, all=both) is installed
36 export OPEN_PDK_ARGS="--with-sky130-variants=A"
37 export MY_PDK=sky130A

```

Its about “NgSpice”. We’ll edit the script to the latest version of NgSpice available. You can check this on their website. For this, search for

NgSpice forgesource → **Downloads** → click on **Souceforge.net File** from text

Latest version is shown at the top

Name	Modified	Size	Downloads / Week
Parent folder			
43	2024-07-13		1,328
42	2023-12-27		262
old-releases	2023-08-15		284
Totals: 3 Items			1,874

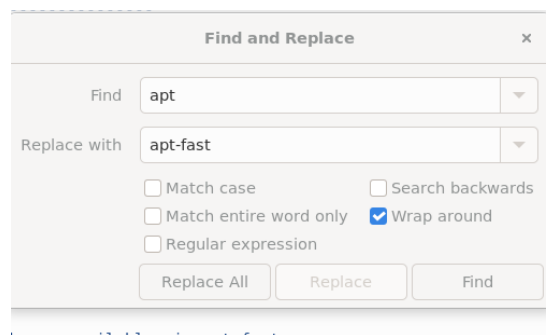

Now edit this in **Line 34** of script.

```
33 export SCRIPT_DIR="$my_dir"
34 export NGSPICE_VERSION=43
35 # This selects which sky130 PD
```

11. -qq is a flag that minimizes the amount of information displayed on the terminal. It can also hide potential errors or warnings. Thus, remove -qq written in script on line 48,49 & 65.

12. Now click on the **hamburger menu icon** shown at top right and **select find and replace**.

Replace **apt** with **apt-fast**.

Click on **Replace all** and then **save**.

13. Run the command again.

- `./iic-osic-setup.sh`

```

namramazhar@DESKTOP-L7738LO:~/osic-multitool$ ./iic-osic-setup.sh
>>>> Update packages

```

wait for the installation to complete..

you should be able to see this at the end

```

>>>> All done. Please test the OpenLane install by running
>>>> make test

Remember to run `source ./iic-init.sh` to initialize environment!
namramazhar@DESKTOP-L7738LO:~/osic-multitool$

```

14. Now we will test the OpenLane installation

In order to do this first run the following cmds

- cd
- source ~/iic-init.sh
- cd OpenLane

you'll be seeing this

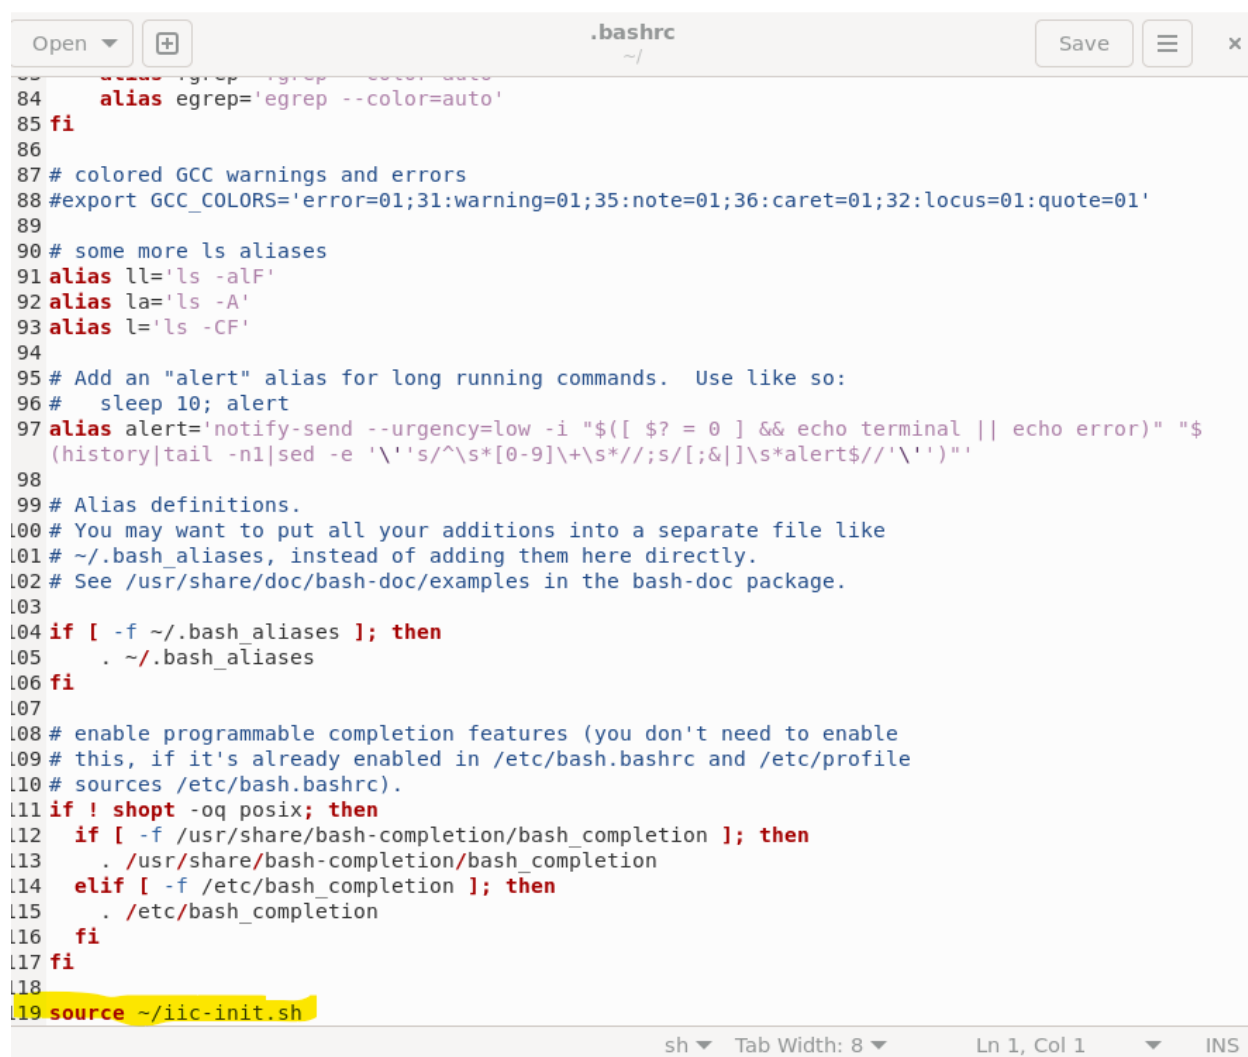

```
namramazhar@DESKTOP-L7738LO:~/OpenLane$
```

Run cmd

- clear
- cd
- gedit .bashrc

15. We'll now edit the batch file. For this, add this cmd at the very end

- source ~/iic-init.sh

```

84 alias egrep='egrep --color=auto'
85 fi
86
87 # colored GCC warnings and errors
88 #export GCC_COLORS='error=01;31:warning=01;35:note=01;36:caret=01;32:locus=01:quote=01'
89
90 # some more ls aliases
91 alias ll='ls -alF'
92 alias la='ls -A'
93 alias l='ls -CF'
94
95 # Add an "alert" alias for long running commands.  Use like so:
96 #   sleep 10; alert
97 alias alert='notify-send --urgency=low -i "$([ $? = 0 ] && echo terminal || echo error)" "$
(history|tail -nl|sed -e '\''s/^\[0-9\]\+\s*//;s/[:;&|]\s*alert$//'\''"'
98
99 # Alias definitions.
100 # You may want to put all your additions into a separate file like
101 # ~/.bash_aliases, instead of adding them here directly.
102 # See /usr/share/doc/bash-doc/examples in the bash-doc package.
103
104 if [ -f ~/.bash_aliases ]; then
105     . ~/.bash_aliases
106 fi
107
108 # enable programmable completion features (you don't need to enable
109 # this, if it's already enabled in /etc/bash.bashrc and /etc/profile
110 # sources /etc/bash.bashrc).
111 if ! shopt -oq posix; then
112     if [ -f /usr/share/bash-completion/bash_completion ]; then
113         . /usr/share/bash-completion/bash_completion
114     elif [ -f /etc/bash_completion ]; then
115         . /etc/bash_completion
116     fi
117 fi
118
119 source ~/iic-init.sh

```

This file will run everytime we'll start the distro.

16. Now we'll **make test** to see if everything works. For this first enter the following cmds

- exit
- wsl
- cd
- cd OpenLane/
- make test

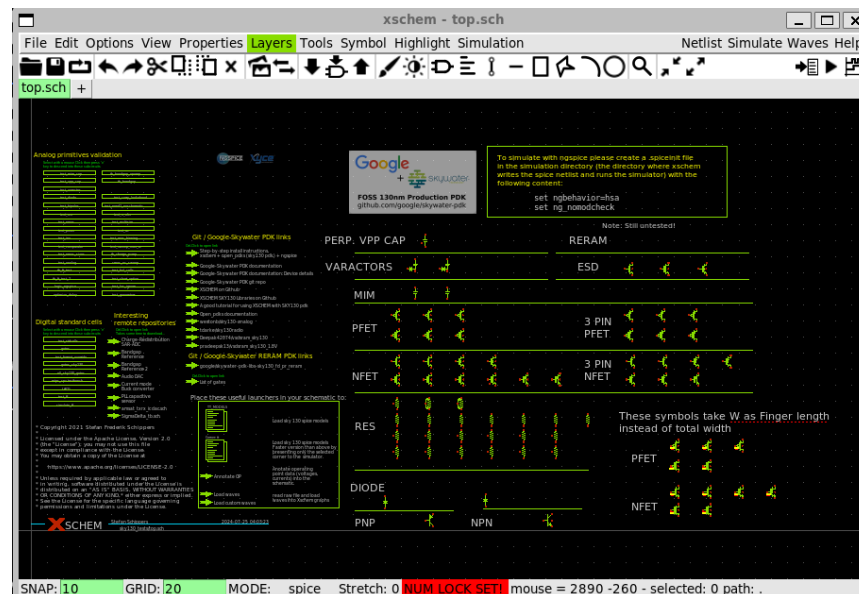

you **should** be able to see this at the very end.

```
Basic test passed
namramazhar@DESKTOP-L7738L0:~/OpenLane$
```

17. Now, we'll check if we have successfully installed xschem. For this, enter

- xschem

Upon successful installation, you'll be able to see this xschem window

18. Correct the setting of PDK environment variable to effectively use ReRAM on xschem running the following cmds

- PDK=sky130B
- Xschem

```
namramazhar@DESKTOP-L7738L0:~/OpenLane$ PDK=sky130B
namramazhar@DESKTOP-L7738L0:~/OpenLane$ xschem
```

And you'll be able to see ReRAM symbol as well on the xschem window

19. We will now be installing GAW. For this, open wsl and activate OpenLane.

```
(base) namramazhar@DESKTOP-L7738L0:~$ cd OpenLane/
(base) namramazhar@DESKTOP-L7738L0:~/OpenLane$
```

20. Update your package list and install the necessary dependencies by entering

- `sudo apt-get update`
- `sudo apt-get install libgtk-3-dev xterm`

you'd be able to see this

```
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
xterm is already the newest version (372-1ubuntu1).
libgtk-3-dev is already the newest version (3.24.33-1ubuntu2.2).
0 upgraded, 0 newly installed, 0 to remove and 29 not upgraded.
(base) namramazhar@DESKTOP-L7738L0:~/OpenLane$
```

21. Consider the link below to download the latest version:

<https://download.tuxfamily.org/gaw/download/>

22. Create Downloads directory under your home directory if you don't already have one by

- `mkdir ~/Downloads`

23. Now consider entering the following cmds to download, navigate and extract the targeted file.

- `wget https://download.tuxfamily.org/gaw/download/gaw3-20220315.tar.gz -O ~/Downloads/gaw3-20220315.tar.gz`

- `cd ~/Downloads`
- `tar -xvzf gaw3-20220315.tar.gz`

24. Now, we will move the extracted folder to the home directory. Enter:

- `mv gaw3-20220315 ~/`

25. Next comes [Configuring and Building GAW](#). For that enter:

- `cd ~/gaw3-20220315`
- `./configure`
- `Make`

26. [Install GAW](#) by entering

- `sudo make install`

27. [Verify](#) installation via following cmd.

- `Gaw`

You'll be seeing this upon successful installation
